

Quantitative Methods in Chemistry

Week 4, Lecture 3

NPTEL

How to use Excel to perform ANOVA

1. Open Excel.
2. Go to “Tools” tab on top. Click it to bring the pop-down menu.
3. Select “Excel Add-ins” at the bottom of the menu.
4. In the pop-up window, choose “Analysis ToolPak” (click on the radio button)
5. Now, on the Worksheet, click on the “Data” tab.
6. Go to “Data Analysis” on far right.
7. Click there to open another pop-up window.
8. Choose “Anova: Single Factor” and click OK.
9. Provide the Input and the Output options.
10. ANOVA table will be displayed.

Least Significant Difference (LSD)

If, $F_{\text{test}} > F_{\text{crit}}$, ANOVA indicates significant difference in the means of two or more samples being compared.

In the above case, we can apply LSD method to evaluate which of the samples are having statistically different means.

LSD =

For t, $N - 1$ degrees of freedom is used.

N_g = No. of replicates in each sample or group.

NPTEL

LSD is the smallest difference between sample means that is considered statistically significant at a particular level of confidence.

F Distribution: Critical Values of F (5% significance level)
