# **Descriptive statistics:**

**First hand tools which gives first hand information.**

- **Central tendency of data**
- **Variation in data**
- **Structure and shape of data tendency**
- **Relationship study**

**Graphical as well as analytical tools are used.**

# **Graphical tools:**

## **Graphical tools- various type of plots**

- 2D & 3D plots,**
- scatter diagram**
- Pie diagram**
- Histogram**
- Bar plot**
- Stem and leaf plot**
- Box plot ...**

## Absolute and relative frequencies:

Suppose there are 10 persons coded into two categories as male (M) and female (F).

M, F, M, F, M, M, M, F, M, M.

Use  $a_1$  and  $a_2$  to refer to male and female categories.

There are 7 male and 3 female persons,

denoted as  $n_1 = 7$  and  $n_2 = 3$

The number of observations in a particular category is called the absolute frequency.

## Absolute and relative frequencies:

The relative frequencies of  $a_1$  and  $a_2$  are

$$f_1 = \frac{n_1}{n_1 + n_2} = \frac{7}{10} = 0.7 = 70\%$$

$$f_2 = \frac{n_2}{n_1 + n_2} = \frac{3}{10} = 0.3 = 30\%$$

This gives us information about the proportions of male and female persons.

## Absolute and relative frequencies:

`table(variable)` creates the absolute frequency of the `variable` of the data file.

Enter data as `x`

`table(x)` # absolute frequencies

`table(x)/length(x)` # relative frequencies

## Absolute and relative frequencies:

Example: Code the 10 persons by using, say 1 for male (M) and 2 for female (F).

M, F, M, F, M, M, M, F, M, M  
1, 2, 1, 2, 1, 1, 1, 2, 1, 1

```
> gender <- c(1, 2, 1, 2, 1, 1, 1, 2, 1, 1)
```

```
> gender
```

```
[1] 1 2 1 2 1 1 1 2 1 1
```

R Console

```
> gender <- c(1, 2, 1, 2, 1, 1, 1, 2, 1, 1)
```

```
> gender
```

```
[1] 1 2 1 2 1 1 1 2 1 1
```

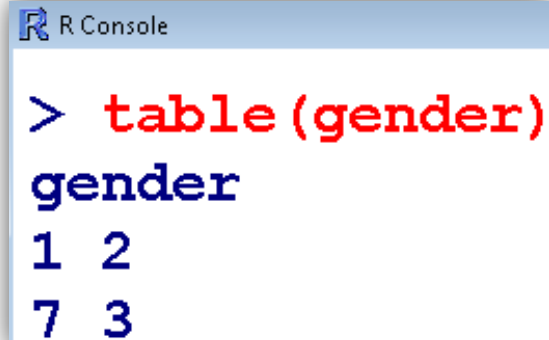

## Absolute and relative frequencies:

```
> table(gender) # Absolute frequencies
```

```
gender
```

```
1 2
```

```
7 3
```

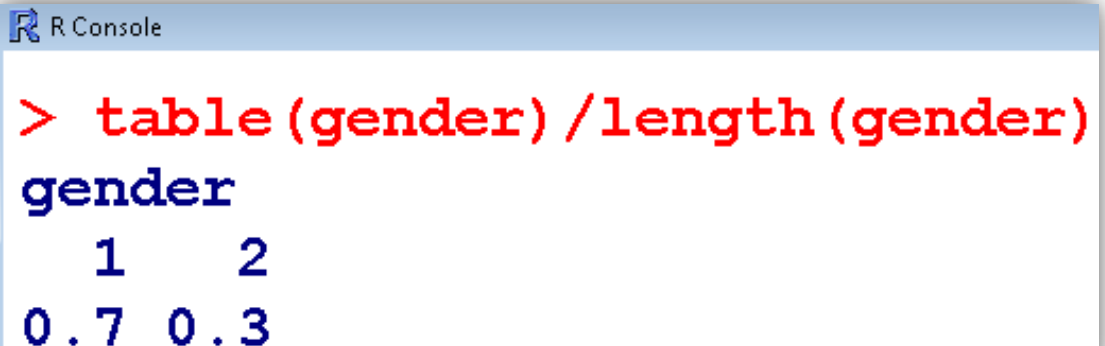

```
R Console  
  
> table(gender)  
gender  
1 2  
7 3
```

```
> table(gender)/length(gender) #Relative freq.
```

```
gender
```

```
1 2
```

```
0.7 0.3
```

```
R Console  
  
> table(gender)/length(gender)  
gender  
1 2  
0.7 0.3
```

## Example:

`'pizza_delivery.csv'` contains the simulated data on pizza home delivery.

- There are three branches (East, West, Central) of the restaurant.
- The pizza delivery is centrally managed over phone and delivered by one of the five drivers.
- The data set captures the number of pizzas ordered and the final bill

```
> setwd( "C:/Rcourse" )
```

```
> pizza <- read.csv( 'pizza_delivery.csv' )
```

## Example:

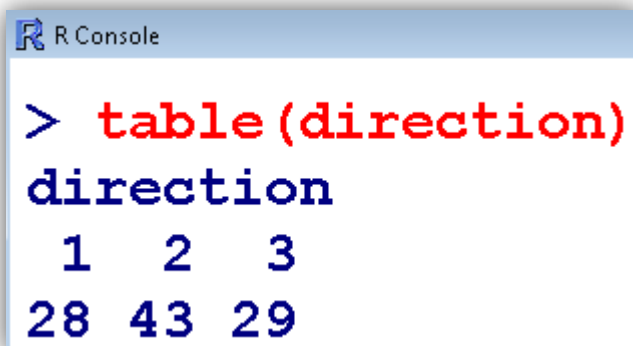

Consider data from Pizza. Take first 100 values from Direction and code Directions as

- ❖ East: 1
- ❖ West: 2
- ❖ Centre: 3

```
direction <-c(1,1,2,1,2,3,2,2,3,3,3,1,2,3,2,2,3,1,  
1,3,3,1,2,1,3,3,3,2,2,2,2,1,2,2,1,1,1,3,2,2,1,2,3,2  
,2,1,2,3,3,2,1,2,2,3,1,1,2,1,2,3,2,3,2,2,3,1,2,3,3,  
3,2,1,1,1,2,1,1,2,1,2,3,3,1,2,3,3,2,1,2,3,2,1,3,2,2  
,2,2,3,2,2)
```

## Example:

```
> table(direction)
direction
 1  2  3
28 43 29
```

A screenshot of an R Console window. The window has a title bar with the R logo and the text "R Console". The console displays the command "> table(direction)" in red text, followed by the output "direction" in blue text. Below "direction", there are two rows of numbers: "1 2 3" and "28 43 29", also in blue text.

```
> table(direction)
direction
 1  2  3
28 43 29
```

## Example:

```
> table(direction)/length(direction)
direction
      1      2      3
0.28 0.43 0.29
```

R Console

```
> table(direction)/length(direction)
direction
      1      2      3
0.28 0.43 0.29
```

## **Partition values:**

Such values divides the total frequency given data into required number of partitions.

**Quartile:** Divides the data into 4 equal parts.

**Decile:** Divides the data into 10 equal parts.

**Percentile:** Divides the data into 100 equal parts.

## Partition values:

**quantile** function computes quantiles corresponding to the given probabilities.

The smallest observation corresponds to a probability of 0 and the largest to a probability of 1.

```
quantile(x, ...)
```

```
quantile(x, probs = seq(0, 1, 0.25),...)
```

### Arguments

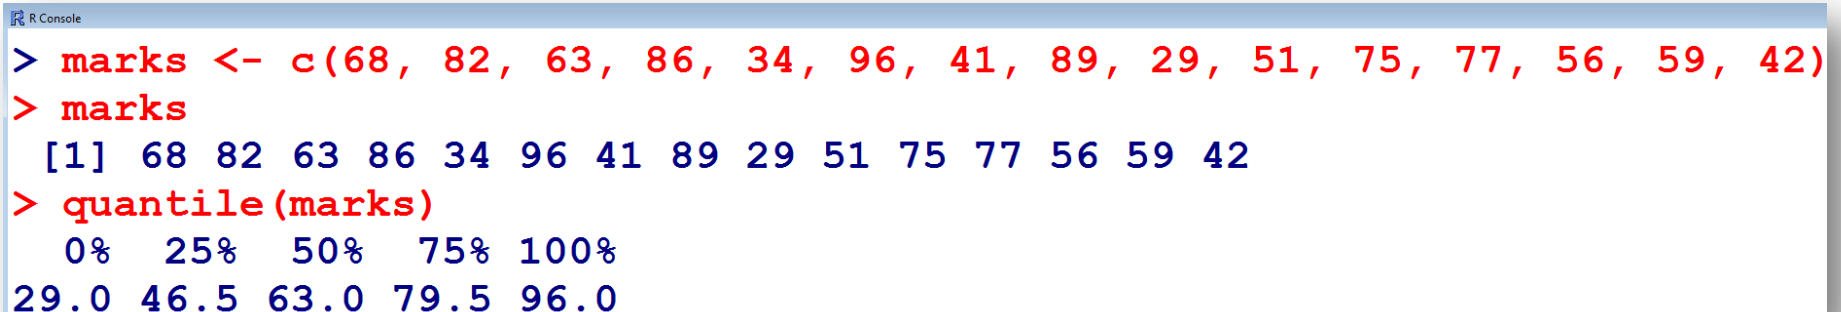

**x** numeric vector whose sample quantiles are wanted,  
**probs** numeric vector of probabilities with values in [0, 1].

## Partition values:

Example: Marks of 15 students are

```
> marks <- c(68, 82, 63, 86, 34, 96, 41, 89,  
             29, 51, 75, 77, 56, 59, 42)
```

```
> quantile(marks)  
   0%   25%   50%   75%  100%  
29.0 46.5 63.0 79.5 96.0
```

```
R Console  
> marks <- c(68, 82, 63, 86, 34, 96, 41, 89, 29, 51, 75, 77, 56, 59, 42)  
> marks  
[1] 68 82 63 86 34 96 41 89 29 51 75 77 56 59 42  
> quantile(marks)  
   0%   25%   50%   75%  100%  
29.0 46.5 63.0 79.5 96.0
```

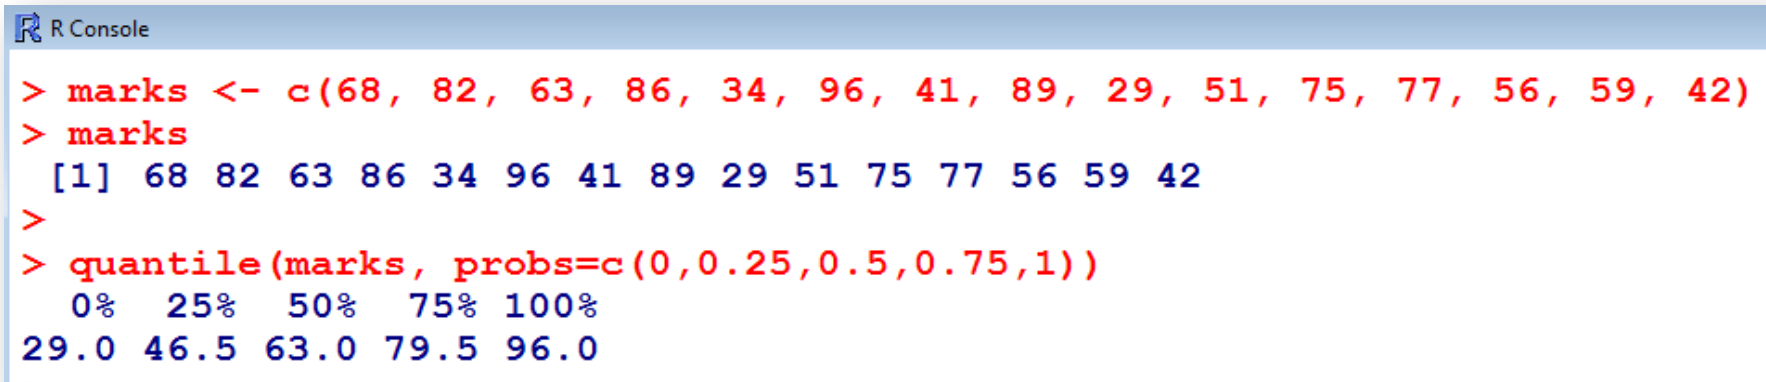

## Partition values:

Example: Marks of 15 students are

```
> marks <- c(68, 82, 63, 86, 34, 96, 41, 89,
  29, 51, 75, 77, 56, 59, 42)

> quantile(marks, probs=c(0,0.25,0.5,0.75,1))
  0%   25%   50%   75%  100%
29.0 46.5 63.0 79.5 96.0
```

## Default values

A screenshot of an R console window with a blue header bar containing the R logo and the text "R Console". The console shows the execution of R code to create a vector of marks and calculate its quantiles. The output of the quantile function is displayed in a formatted table.

```
R Console

> marks <- c(68, 82, 63, 86, 34, 96, 41, 89, 29, 51, 75, 77, 56, 59, 42)
> marks
[1] 68 82 63 86 34 96 41 89 29 51 75 77 56 59 42
>
> quantile(marks, probs=c(0,0.25,0.5,0.75,1))
  0%   25%   50%   75%  100%
29.0 46.5 63.0 79.5 96.0
```

# Partition values:

Example: Marks of 15 students are

```
> marks <- c(68, 82, 63, 86, 34, 96, 41, 89, 29,
  51, 75, 77, 56, 59, 42)
```

Defining probabilities

```
> quantile(marks, probs=c(0,0.20,0.4,0.6,0.8,1))
  0%   20%   40%   60%   80%  100%
29.0  41.8  57.8  70.8  82.8  96.0
```

```
R Console
> marks <- c(68, 82, 63, 86, 34, 96, 41, 89, 29, 51, 75, 77, 56, 59, 42)
> marks
[1] 68 82 63 86 34 96 41 89 29 51 75 77 56 59 42
> quantile(marks, probs=c(0,0.20,0.4,0.6,0.8,1))
  0%   20%   40%   60%   80%  100%
29.0  41.8  57.8  70.8  82.8  96.0
```
