## TUTORIAL-04: SHELL TARGETING

## Based on Lecture-15: Shell Targeting - $\mathbf{1}^{\text {st }}$ Part

Problem 1: Compute the number of shells targeted for the stream data shown in Table 1.
Given: Hot utility temperature range: 400 to $399^{\circ} \mathrm{C}$
Cold utility temperature range: 10 to $15^{\circ} \mathrm{C}$
$\Delta \mathrm{T}_{\text {min }}=10^{\circ} \mathrm{C}$
Table 1: Stream data for Problem 1

| Stream | Supply temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Target temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Heat capacity flow <br> rate $\left(\mathrm{kW}^{0} \mathrm{C}^{-1}\right)$ |
| :--- | :--- | :--- | :--- |
| HOT (H1) | 290 | 70 | 28 |
| HOT (H2) | 190 | 30 | 40 |
| COLD (C1) | 50 | 190 | 38 |
| COLD (C2) | 150 | 290 | 60 |

Solution 1: The amount of hot and cold utilities and the pinch temperature are required to target number of shells. These values are computed using Problem Table Algorithm as described in Problem 1 of Tutorial-02 and shown below:

Minimum hot utility: 5080 kW
Minimum cold utility: 3920 kW
Pinch temperature: $155^{\circ} \mathrm{C}$
Hot pinch temperature: $160^{\circ} \mathrm{C}$
Cold pinch temperature: $150^{\circ} \mathrm{C}$
To compute the data for balanced hot composite curve (BHCC), temperatures and CP values of hot streams (H1, H2), shown in Table 1, and Hot utility (HU) are considered. The detailed computation for BHCC is shown in Table 2. Similarly, data of balanced cold composite curve (BCCC) is computed and presented in Table 3.

Table 2: Data for BHCC

| Temperature $\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{CP}=40$ |  | $\begin{aligned} & \text { Cum CP } \\ & \left(\mathrm{kW}^{0} \mathrm{C}^{-1}\right) \end{aligned}$ | $\begin{aligned} & \mathrm{Q}_{\mathrm{h}}=\Delta \mathrm{T}^{*} \mathrm{cum} \\ & \mathrm{CP}(\mathrm{~kW}) \end{aligned}$ | $\begin{array}{\|l} \hline \operatorname{Cum~}_{(\mathrm{kW})} \mathrm{Q}_{\mathrm{h}} \\ \hline \end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 30 | $\mathrm{CP}=28$ |  | 0 | 0 | 0 |
| 70 | 4 |  | 40 | 1600 | 1600 |
| 190 |  |  | 68 | 8160 | 9760 |
| 290 | H2 | $\mathrm{CP}=5080$ | 28 | 2800 | 12560 |
| 399 | H1 |  | 0 | 0 | 12560 |
| 400 |  |  | 5080 | 5080 | 17640 |

Table 3: Data for BCCC

| Temperature $\left({ }^{\circ} \mathrm{C}\right)$ | CU | $\begin{array}{\|l\|} \hline \operatorname{Cum~CP}_{\left(\mathrm{kW}^{0} \mathrm{C}^{-1}\right)} \\ \hline \end{array}$ | $\begin{aligned} & \mathrm{Q}_{\mathrm{c}}=\Delta \mathrm{T}^{*} \text { cum } \mathrm{CP} \\ & (\mathrm{~kW}) \end{aligned}$ | $\begin{aligned} & \mathrm{Cum} \mathrm{Q}_{\mathrm{c}} \\ & (\mathrm{~kW}) \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| 10 |  | 0 | 0 | 0 |
| 15 |  | 784 | 3920 | 3920 |
| 50 | CP=784  <br>  C 2 | 0 | 0 | 3920 |
| 150 |  | 38 | 3800 | 7720 |
| 190 |  | 98 | 3920 | 11640 |
| 290 | CP=38 | 60 | 6000 | 17640 |

Data of BHCC and BCCC are plotted in Figure 1 using Cum $\mathrm{Q}_{\mathrm{h}}$ and $\operatorname{Cum} \mathrm{Q}_{\mathrm{c}}$ of Table 2 and 3, respectively. Further, cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are presented in Table 4. In this table the cumulative enthalpies are also shown where unknown temperatures of BHCC and BCCC are available.

Figure 1: Balanced hot and cold composite curves
Table 4: Calculation of unknown temperatures of BHCC and BCCC

| Enthalpy <br> interval no | Cum <br> enthalpy <br> $(\mathrm{kW})$ | $\mathrm{Th}_{\mathrm{i}}\left({ }^{\circ} \mathrm{C}\right)$ | BHCC <br> temperature | $\mathrm{Tc}_{\mathrm{i}}\left({ }^{\circ} \mathrm{C}\right)$ | BCCC <br> temperature | Cum CP <br> $\left(\mathrm{kW} /{ }^{\circ} \mathrm{C}\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 30 | $\mathrm{Th}_{1}$ | 10 | $\mathrm{Tc}_{1}$ | 0 |
| 2 | 3920 | Unknown | $\mathrm{Th}_{3}$ | 15 | $\mathrm{Tc}_{3}$ | 784 |
| 3 | 3920 | Unknown | $\mathrm{Th}_{4}$ | 50 | $\mathrm{Tc}_{4}$ | 0 |
| 4 | 7720 | Unknown | $\mathrm{Th}_{5}$ | 150 | $\mathrm{Tc}_{5}$ | 38 |
| 5 | 9760 | 190 | $\mathrm{Th}_{6}$ | Unknown | $\mathrm{Tc}_{6}$ | 68 |
| 6 | 11640 | Unknown | $\mathrm{Th}_{7}$ | 190 | $\mathrm{Tc}_{7}$ | 98 |
| 7 | 12560 | 290 | $\mathrm{Th}_{8}$ | Unknown | $\mathrm{Tc}_{8}$ | 28 |
| 8 | 12560 | 399 | $\mathrm{Th}_{9}$ | Unknown | $\mathrm{Tc}_{9}$ | 0 |
| 9 | 17640 | 400 | $\mathrm{Th}_{10}$ | 290 | $\mathrm{Tc}_{10}$ | 60 |

Now, the unknown temperatures of BHCC and BCCC in each enthalpy interval are computed as described for Problem 1 of Tutorial-03 and shown below:
$\mathrm{Th}_{3}=104.12^{\circ} \mathrm{C}$
$\mathrm{Th}_{4}=104.12^{\circ} \mathrm{C}$
$\mathrm{Th}_{5}=160^{\circ} \mathrm{C}$
$\mathrm{Th}_{7}=257.14^{\circ} \mathrm{C}$
$\mathrm{Tc}_{2}=12^{\circ} \mathrm{C}$
$\mathrm{Tc}_{6}=170.82$
$\mathrm{Tc}_{8}=205.33^{\circ} \mathrm{C}$
$\mathrm{Tc}_{9}=205.33^{\circ} \mathrm{C}$
The values of all temperatures of BHCC and BCCC are shown in Table 5. Further, calculation of number of shells is carried out, which requires following equations:
$P=\left(\frac{T_{1}-T_{2}}{T_{1}-t_{1}}\right)$
$R=\left(\frac{t_{2}-t_{1}}{T_{1}-T_{2}}\right)$
$P_{12}=X_{P} * P_{M A X}$
$P_{M A X}=\left[\frac{2}{(R+1)+\left(R^{2}+1\right)^{1 / 2}}\right]$
if $\mathrm{R}=1$ :
$S=\frac{[P /(1-P)]}{P_{12} /\left(1-P_{12}\right)}$
Else -
$S=\frac{\ln \left[\frac{(1-R P)}{(1-P)}\right]}{\ln \left[\frac{\left.1-R P_{12}\right)}{\left(1-P_{12}\right)}\right]}$
No of shell $=S *(N-1)$
Where, $N$ is the number of streams
Calculation of the number of shells for first enthalpy interval is carried out as:
Eq. 1 is used to calculate $P$ where $T_{1}, T_{2}$ and $t_{1}$ are considered as 70,30 and 10 , respectively. These values are taken from Table 5 for interval no. 1 .
$P=\frac{(70-30)}{(70-10)}=0.667$
Value of R is computed using Eq. 2 where $\mathrm{T}_{1}, \mathrm{~T}_{2}, \mathrm{t}_{1}$, and $\mathrm{t}_{2}$ are considered as 70, 30, 10 and 12, respectively, from interval no. 1 as shown in Table 5.
$R=\frac{(12-10)}{70-30)}=0.05$
Eq. 4 is used to calculate $\mathrm{P}_{\text {max }}$, where $\mathrm{R}=0.05$
$P_{\max }=\frac{2}{(0.05+1)+\left(0.05^{2}+1\right)^{1 / 2}}=0.9750$
$P_{12}$ is predicted using Eq. 3 where $X_{P}$ is considered as 0.9.
$\mathrm{P}_{12}=0.9 * 0.9750=0.8775$
As $\mathrm{R} \neq 1$, Eq. 6 is used to calculate S , where R and P are taken as 0.05 and 0.667 , respectively. Thus,
$S=\frac{\ln \left[\frac{(1-0.05 * 0.667)}{(1-0.667)}\right]}{\ln \left[\frac{(1-0.05 * 0.8775)}{1-0.8775}\right]}=0.5186$
N is the number of streams lying in the corresponding enthalpy interval. For interval no. 1, N is 2 as shown in Table 5. Thus, the number of shells for this interval is computed as

No of shell $=S *(N-1)=0.5186(2-1)=0.5186$
The overall calculation for the shells is presented in Table 5.

Table 5: Calculation of the number of shells

| Enthalpy <br> interval <br> no. | Enthalpy <br> $(\mathrm{kW})$ | $\mathrm{T}_{\mathrm{h}}\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{T}_{\mathrm{c}}\left({ }^{\circ} \mathrm{C}\right)$ | P | R | $\mathrm{P}_{12}$ | S | N | $\mathrm{~S}(\mathrm{~N}-1)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 30 | 10 | - | - | - | - | - | - |
| 1 | 1600 | 70 | 12 | 0.667 | 0.05 | 0.8775 | 0.5186 | 2 | 0.5186 |
| 2 | 3920 | 104.12 | 15 | 0.37 | 0.0879 | 0.86 | 0.2273 | 3 | 0.4546 |
| 3 | 3920 | 104.12 | 50 | 0 | - | - | - | - | - |
| 4 | 7720 | 160 | 150 | 0.508 | 1.7895 | 0.3719 | 2.679 | 3 | 5.358 |
| 5 | 9760 | 190 | 170.82 | 0.75 | 0.694 | 0.6183 | 1.6178 | 4 | 4.8534 |
| 6 | 11640 | 257.14 | 190 | 0.778 | 0.2857 | 0.7739 | 1.0136 | 3 | 2.0272 |
| 7 | 12560 | 290 | 205.33 | 0.3286 | 0.4665 | 0.70 | 0.2869 | 2 | 0.2869 |
| 8 | 12560 | 399 | 205.33 | 0.5628 | - | - | - | - | - |
| 9 | 17640 | 400 | 290 | $5.14 \mathrm{e}-03$ | 84.67 | 0.01056 | 0.2533 | 2 | 0.2533 |

As hot and cold pinch temperatures are $160^{\circ} \mathrm{C}$ and $150^{\circ} \mathrm{C}$, So
No. of shells below the pinch is $\approx 7(0.5186+0.4546+5.358=6.3312)($ from interval 0 to 4$)$
No. of shells above the pinch is $\approx 8(4.8534+2.0272+0.2869+0.2533=7.4208)$ (from interval 5 to 9 )

Thus, the total no. of shells $=$ No. of shells above the pinch + No. of shells below the pinch

$$
=8+7=15
$$

Problem 2: Compute the number of shells required for the given data in Table 6. For this problem the value of $\Delta \mathrm{T}_{\text {min }}$ is $10^{\circ} \mathrm{C}$.

Table 6: Stream data for Problem 2

| Streams | Supply <br> temperature $\left({ }^{\circ} \mathrm{C}\right)$ | Target <br> temperature $\left({ }^{\circ} \mathrm{C}\right)$ | Heat capacity <br> $\mathrm{kW}{ }^{\circ} \mathrm{C}^{-1}$ |
| :--- | :--- | :--- | :--- |
| HOT (H1) | 170 | 65 | 25 |
| HOT (H2) | 230 | 50 | 35 |
| COLD (C1) | 35 | 225 | 32 |
| COLD (C2) | 125 | 305 | 22 |
| COLD <br> UTILITY(CU) | 30 | 324 |  |
| HOT UTILITY <br> (HU) | 325 |  |  |

Solution 2: The amount of hot and cold utilities and the pinch temperature are required to target number of shells, which are computed using Problem Table Algorithm as described in Problem 1 of Tutorial-03 and shown below:

Amount of hot utility : 3170 kW
Amount of cold utility : 2055 kW
Pinch temperature: $165^{\circ} \mathrm{C}$
Hot pinch temperature : $170^{\circ} \mathrm{C}$
Cold pinch temperature : $160^{\circ} \mathrm{C}$
CP of hot utility : $\quad 3170 /(325-324)=3170 \mathrm{~kW} .{ }^{\circ} \mathrm{C}^{-1}$
CP of cold utility : $\quad 2055 /(40-30)=205.5 \mathrm{~kW} .{ }^{\circ} \mathrm{C}^{-1}$
The computation for BHCC and BCCC are shown in Table 7 and 8, respectively.

Table 7: Data for BHCC

Table 8: Data for BCCC

Data of BHCC and BCCC are plotted in Figure 2 using Cum $\mathrm{Q}_{\mathrm{h}}$ and $C u m \mathrm{Q}_{\mathrm{c}}$ of Table 7 and 8 , respectively. Further, cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are presented in Table 9. The unknown temperatures in each enthalpy interval of Table 9 are computed as described for Problem 1 of Tutorial-03. The values of all temperatures of BHCC and BCCC are shown in Table 10.

Figure 2: Graphical representation of balanced hot and cold composite curve

Table 9: Calculation of unknown temperatures of balanced hot and cold composite curve

| Enthalpy <br> interval <br> number | Cum <br> enthalpy <br> (kW) | $\mathrm{T}_{\mathrm{HI}}\left({ }^{\circ} \mathrm{C}\right)$ | BHCC <br> temperature | $\mathrm{T}_{\mathrm{CI}}\left({ }^{\circ} \mathrm{C}\right)$ | BCCC <br> temperature | Cum CP <br> $\left(\mathrm{kW} /{ }^{\circ} \mathrm{C}\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 50 | $\mathrm{~T}_{\mathrm{H} 1}$ | 30 | $\mathrm{~T}_{\mathrm{C} 1}$ | 0 |
| 1 | 525 | 65 | $\mathrm{~T}_{\mathrm{H} 2}$ | Unknown | $\mathrm{T}_{\mathrm{C} 2}$ | 35 |
| 2 | 1027.5 | Unknown | $\mathrm{T}_{\mathrm{H} 3}$ | 35 | $\mathrm{~T}_{\mathrm{C} 3}$ | 205.5 |
| 3 | 2215 | Unknown | $\mathrm{T}_{\mathrm{H} 4}$ | 40 | $\mathrm{~T}_{\mathrm{C} 4}$ | 237.5 |
| 4 | 4935 | Unknown | $\mathrm{T}_{\mathrm{H} 5}$ | 125 | $\mathrm{~T}_{\mathrm{C} 5}$ | 32 |
| 5 | 6825 | 170 | $\mathrm{~T}_{\mathrm{H} 6}$ | Unknown | $\mathrm{T}_{\mathrm{C} 6}$ | 60 |
| 6 | 8925 | 230 | $\mathrm{~T}_{\mathrm{H} 7}$ | Unknown | $\mathrm{T}_{\mathrm{C} 7}$ | 35 |
| 7 | 8925 | 324 | $\mathrm{~T}_{\mathrm{H} 8}$ | Unknown | $\mathrm{T}_{\mathrm{C} 8}$ | 0 |

|  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 8 | 10335 | Unknown | $\mathrm{T}_{\mathrm{H} 9}$ | 225 | $\mathrm{~T}_{\mathrm{C} 9}$ | 54 |
| 9 | 12095 | 325 | $\mathrm{~T}_{\mathrm{H} 10}$ | 305 | $\mathrm{~T}_{\mathrm{C} 10}$ | 3170 |

Further, calculation of number of shell is carried out using Eq. 1 to 7 as described for Problem 1. The overall calculation for shell targeting is presented in Table 10.

Table 10: Computation of number of shells

| Enthalpy <br> interval <br> no. | Enthalpy <br> $(\mathrm{kW})$ | $\mathrm{T}_{\mathrm{H}}$ <br> $\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{T}_{\mathrm{C}}$ <br> $\left({ }^{\circ} \mathrm{C}\right)$ | P | R | $\mathrm{P}_{12}$ | S | $\mathrm{~N}_{\mathrm{I}}$ | $\mathrm{S}\left(\mathrm{N}_{\mathrm{I}}-1\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 50 | 30 | - | - | - | - | - | - |
| 1 | 525 | 65 | 32.55 | 0.428 | 0.17 | 0.824 | 0.3045 | 2 | 0.3045 |
| 2 | 1027.5 | 73.375 | 35 | 0.205 | 0.2925 | 0.77 | 0.1375 | 3 | 0.275 |
| 3 | 2215 | 93.167 | 40 | 0.3403 | 0.2526 | 0.788 | 0.2453 | 4 | 0.7359 |
| 4 | 4935 | 138.5 | 125 | 0.46 | 1.875 | 0.36 | 2.0187 | 3 | 4.0374 |
| 5 | 6825 | 170 | 160 | 0.7 | 1.11 | 0.499 | 2.556 | 4 | 7.668 |
| 6 | 8925 | 230 | 198.89 | 0.857 | 0.648 | 0.6339 | 2.3838 | 3 | 4.7676 |
| 7 | 8925 | 324 | 198.89 | 0.7513 | - | - | - | - | - |
| 8 | 10335 | 324.45 | 225 | $3.58 \mathrm{e}-03$ | 58.022 | 0.0154 | 0.1031 | 3 | 0.2062 |
| 9 | 12095 | 325 | 305 | $5.5 \mathrm{e}-03$ | 145.45 | $6.166 \mathrm{e}-03$ | 0.7079 | 2 | 0.7079 |

As the hot pinch temperature is $170^{\circ} \mathrm{C}$ and the cold pinch temperature is $160^{\circ} \mathrm{C}$, so
No. of shells below the pinch $\approx 13(0.3045+0.275+0.7359+4.0374+7.668=13.208)$ (from interval 0 to 5)

No. of shells above the pinch $\approx 6(4.7676+0.2062+0.7079=5.6817)($ from interval 6 to 9$)$
So, the total no. of shells are $=$ No of shells above the pinch + No of shells below the pinch

$$
=13+6=19
$$
