## TUTORIAL-03: AREA TARGETING

## Based on

Lecture-17: AREA TARGETING -1 ${ }^{\text {st }}$ Part ( Unequal film heat transfer coefficient ) Lecture-18: AREA TARGETING -2 ${ }^{\text {nd }}$ Part ( Equal stream heat transfer coefficient )

Problem 1: Compute area targeting for stream data shown in Table 1 where two hot streams exchange heat against a single cold stream using $\Delta \mathrm{T}_{\min }$ as $10^{\circ} \mathrm{C}$. The overall heat transfer coefficient U is constant and equal to $0.123 \mathrm{~kW} \cdot \mathrm{~m}^{-2} \mathrm{~K}^{-1}$ for all exchangers.

Table 1: Stream data for problem 1

| stream | Supply <br> temperature <br> $\mathrm{Ts}\left({ }^{\circ} \mathrm{C}\right)$ | Target <br> temperature <br> $\mathrm{Tt}\left({ }^{\circ} \mathrm{C}\right)$ | Heat capacity <br> flow rate, <br> $\mathrm{CP}\left(\mathrm{kW} .{ }^{\circ} \mathrm{C}^{-1}\right)$ |
| :---: | :---: | :---: | :---: |
| HOT (H1) | 180 | 140 | 1.4 |
| HOT (H2) | 150 | 90 | 2.5 |
| COLD (C1) | 70 | 150 | 4 |

Solution 1: To calculate the area target for the given stream data in Table 1, first the amount of hot and cold utility and the pinch temperature should be known. For this purpose all steps used for Problem 1 of Tutorial- 02 should be followed. The shifted temperatures and problem table cascade for the present problem are shown in Table 2 and Figure 1, respectively.

Table 2: Shifted temperature data for the stream data of Table 1

| Stream | Supply <br> temperature <br> $\mathrm{Ts}\left({ }^{\circ} \mathrm{C}\right)$ | Target <br> temperature <br> $\mathrm{Ttt}\left({ }^{\circ} \mathrm{C}\right)$ | Shifted supply <br> temperature <br> $\mathrm{Ts}\left({ }^{\circ} \mathrm{C}\right)$ | Shifted target <br> temperatures <br> $\mathrm{Tt}\left({ }^{\circ} \mathrm{C}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| HOT (H1) | 180 | 140 | 175 | 135 |
| HOT (H2) | 150 | 90 | 145 | 85 |
| COLD (C1) | 70 | 150 | 75 | 155 |

Figure 1: Problem table analysis for the determination of the amount of hot and cold utility

From the problem table analysis it is clear that-
Hot utility : 114 kW
Cold utility : 0 kW
Pinch temperature : $75^{\circ} \mathrm{C}$
Hot pinch temperature : $80^{\circ} \mathrm{C}$
Cold pinch temperature : $70^{\circ} \mathrm{C}$
As there is no requirement of cold utility the present problem is a threshold problem.
Let the temperatures of hot utility is from $190^{\circ} \mathrm{C}$ to $189^{\circ} \mathrm{C}$. Thus, CP of hot utility is found as $114 \mathrm{~kW} /{ }^{\circ} \mathrm{C}$.

For data of balanced hot composite curve (BHCC) temperatures and CP values of hot streams ( $\mathrm{H} 1, \mathrm{H} 2$ ) and hot utility ( HU ) are considered. The detailed computation for BHCC is shown in Table 3.

Table 3: Table for BHCC data

| 2.5 |  |  | $\sum \mathrm{CP}, \mathrm{hb}\left(\mathrm{kW} .{ }^{\circ} \mathrm{C}^{-1}\right)$ | $\begin{aligned} & \mathrm{Q}_{\mathrm{hb}}=\Delta \mathrm{T}^{*} \sum \mathrm{CP}, \mathrm{hb} \\ & (\mathrm{~kW}) \end{aligned}$ | $\begin{aligned} & \text { Cum } \mathrm{Q}_{\mathrm{hb}} \\ & (\mathrm{~kW}) \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1.4 - |  |  | 0 | 0 | 0 |
| 150 |  |  | 2.5 | 125 | 125 |
|  | H2 |  | 3.9 | 39 | 164 |
| 180 | 114 |  | 1.4 | 42 | 206 |
| 189 | $4$ |  | 0 | 0 | 206 |
| 190 |  | HU | 114 | 114 | 320 |

Similarly, data of balanced cold composite curve (BCCC) is computed and shown in Table 4.
Table 4: Table for BCCC data curve

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | $\sum \mathrm{CP}_{\mathrm{hb}}$ <br> $\left(\mathrm{kW} .{ }^{\circ} \mathrm{C}^{-1}\right)$ | $\mathrm{Q}_{\mathrm{hb}}=\Delta \mathrm{T}^{*} \sum \mathrm{CP}_{\mathrm{hb}}$ <br> $(\mathrm{kW})$ | Cum $\mathrm{Q}_{\mathrm{hb}}$ <br> $(\mathrm{kW})$ |
| :---: | :---: | :---: | :---: |
| 70 | 0 | 0 | 0 |
| 150 | 4 | 320 | 320 |

Necessary data for plotting BHCC and BCCC are extracted from Table 3 and 4, respectively, and shown in Table 5 and 6. Using these data BHCC and BCCC and plotted in Figure 2. From this figure it can be seen that what temperatures of BHCC are unknown corresponds to the known data of BCCC and vice versa.

Table 5: Data for plotting the BHCC

| Thb $\left({ }^{\circ} \mathrm{C}\right)$ | Cum Qhb (kW) |
| :---: | :---: |
| 90 | 0 |
| 140 | 125 |
| 150 | 164 |
| 180 | 206 |
| 189 | 206 |
| 190 | 320 |

Table 6: Data for plotting the BCCC

| Tcb $\left({ }^{\circ} \mathrm{C}\right)$ | Cum Qcb $(\mathrm{kW})$ |
| :---: | :---: |
| 70 | 0 |
| 150 | 320 |

Cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are presented in Table 7. In this table the cumulative enthalpies where temperatures of BCCC are unknown are also shown.

Figure 2: Balanced hot and cold composite curve

Table 7: Calculation of unknown temperatures of BHCC and BCCC

| Enthalpy <br> interval <br> No. | Cumulative <br> enthalpy,kW <br> CumQ | $\mathrm{T}_{\mathrm{hi}}\left({ }^{\circ} \mathrm{C}\right)$ | BHCC <br> $\mathrm{Temp}$. | $\mathrm{~T}_{\mathrm{ci}}\left({ }^{\circ} \mathrm{C}\right)$ | BCCC <br> Temp. | $\Sigma \mathrm{CP}$ <br> $\mathrm{kW} /{ }^{\circ} \mathrm{C}$ |
| :---: | :---: | :---: | :--- | :---: | :---: | :---: |
| 1 | 0 | 90 | Th 1 | 70 | Tc 1 | 0 |
| 2 | 164 | 150 | Th 3 | unknown | Tc 3 | 3.9 |
| 3 | 206 | 180 | Th4 | unknown | Tc 4 | 1.4 |
| 4 | 206 | 189 | Th5 | unknown | Tc 5 | 0 |
| 5 | 320 | 190 | Th6 | 150 | Tc 6 | 4 |

To calculate the unknown temperatures in each enthalpy interval following equation is used:

$$
\mathrm{T}_{\mathrm{c} 2}=\mathrm{T}_{\mathrm{cb} \text { row } \mathrm{r}}-\left(\mathrm{CumQ}_{\mathrm{cb} \text {, row } \mathrm{r}^{-}} \mathrm{CumQ}\right) / \Sigma \mathrm{CP}_{\mathrm{cb} \text { row } \mathrm{r}}
$$

Where,
$\mathrm{T}_{\mathrm{cb} \text { row r: }}$ Temperature for cold balanced curve in row r (for which temperature is known)
CumQ $_{\text {cb, row r }}$ : Cum Q for cold balanced curve in row r
CumQ: Cum Q for the cold balanced curve for which the temperature is to be calculated
$\Sigma C P_{\text {, cb row r }}: \Sigma C P$ for the cold balanced curve in row $r$ (for which the temperature is known)
$\mathrm{T}_{\mathrm{c} 2}$ is computed using $\mathrm{T}_{\mathrm{cb} \text { row } \mathrm{r}}, \mathrm{CumQ}_{\mathrm{cb} \text {, row } \mathrm{r}}, \mathrm{CumQ}$ and $\Sigma \mathrm{CP}_{\mathrm{cb} \text {, row } \mathrm{r}}$ as $150,320,125$ and 4 , respectively, from Table 7. Thus,
$\mathrm{Tc} 2=150-((320-125) /(4))=101.25^{\circ} \mathrm{C}$
Similarly,
$\mathrm{Tc} 3=150-((320-164) /(4))=111^{\circ} \mathrm{C}$
$\mathrm{Tc} 4=150-((320-206) /(4))=121.5^{\circ} \mathrm{C}$
$\mathrm{Tc} 5=150-((320-206) /(4))=121.5^{\circ} \mathrm{C}$

Cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are shown in Table 8.

As overall heat transfer coefficient, U , is given the area for the given stream data can be calculated as:

$$
\begin{aligned}
\Delta \mathrm{Q} & =\mathrm{U} * \mathrm{~A} * \Delta \mathrm{~T}_{\mathrm{lm}} \\
\mathrm{~A} & =\frac{\Delta \mathrm{Q}}{\mathrm{U} * \Delta \mathrm{~T}_{\mathrm{lm}}}
\end{aligned}
$$

Where,
$\Delta Q$ is the cumulative enthalpy for the different interval $(\mathrm{kW})$
$\Delta \mathrm{T}_{\mathrm{lm}}$ is the $\log$ mean temperature difference between the hot and cold stream $\left({ }^{\circ} \mathrm{C}\right)$
$\Delta T_{1 m}$ and the area for the different enthalpy intervals can be calculated as -
For interval No. 1 -
$\Delta \mathrm{T}_{\operatorname{lm} 1}=(90-70)-(140-101.25) / \ln (20 / 38.75)=28.349^{\circ} \mathrm{C}$
$\mathrm{A}_{1}=\frac{\Delta \mathrm{Q}_{1}}{\mathrm{U} * \Delta \mathrm{~T}_{\mathrm{lm} 1}}=\frac{(125-0)}{(0.123 * 28.349)}=35.975 \mathrm{~m}^{2}$
For interval No.2-
$\Delta \mathrm{T}_{\operatorname{lm} 2}=(140-101.25)-(150-111) / \ln (38.75 / 39)=38.875^{\circ} \mathrm{C}$
$\mathrm{A}_{2}=\frac{\Delta \mathrm{Q}_{2}}{\mathrm{U} * \Delta \mathrm{~T}_{\mathrm{lm} 2}}=\frac{(164-125)}{(0.123 * 38.875)}=8.1562 \mathrm{~m}^{2}$
The calculation of area for each enthalpy interval is shown in Table 8 which gives total heat transfer area as $\mathbf{6 8 . 8 6 6} \mathbf{~ m}^{2}$.

Table 8: Calculation of area target for the given stream network

Problem 2: For a process the stream data together with utility data and heat transfer coefficients are shown in Table 9 , where $\Delta \mathrm{T}_{\text {min }}$ is selected as $10^{\circ} \mathrm{C}$. Steam from $250^{\circ} \mathrm{C}$ to $249^{\circ} \mathrm{C}$ is to be used as hot utility, however, cold water at $25^{\circ} \mathrm{C}$ and returning to the cooling tower at $35^{\circ} \mathrm{C}$ is to be used as cold utility. Target the heat exchange area for this process.

Table 9: The stream and utility data for the process

| Stream | Supply <br> temperature <br> $\mathrm{T}_{\mathrm{s}}\left({ }^{\circ} \mathrm{C}\right)$ | Target <br> temperature <br> $\mathrm{T}_{\mathrm{T}}\left({ }^{\circ} \mathrm{C}\right)$ | $\Delta \mathrm{H}$ <br> $(\mathrm{MW})$ | Heating <br> capacity flow <br> rate, CP <br> $\left(\mathrm{MW} .{ }^{\circ} \mathrm{C}^{-1}\right)$ | Film heat <br> transfer <br> coefficient, h <br> $\left(\mathrm{MW} \cdot \mathrm{m}^{-2} . \mathrm{O}^{-1}\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Cold (C1) | 25 | 185 | 32.0 | 0.25 | 0.0008 |
| Hot (H1) | 260 | 50 | -31.5 | 0.16 | 0.0009 |
| Cold (C2) | 145 | 235 | 27.0 | 0.32 | 0.0009 |
| Hot (H2) | 190 | 70 | -30.0 | 0.26 | 0.0010 |
| Steam (HU) | 250 | 249 | 35 |  | 0.0040 |
| Cold water <br> (CU) | 25 |  |  |  | 0.0010 |

Solution 2: To calculate area target for the given stream data in Table 9 the amount of hot and cold utility is computed using Problem Table Algorithm (PTA) as carried out for Problem 1. From PTA following results are found:

Amount of hot utility: 12.9 MW
Amount of cold utility: 8.90 MW
Pinch point: $150^{\circ} \mathrm{C}$
Hot pinch: $155^{\circ} \mathrm{C}$
Cold pinch: $145^{\circ} \mathrm{C}$
CP of hot and cold utility are computed as $12.9 \mathrm{MW} /{ }^{\circ} \mathrm{C}$ and $0.89 \mathrm{MW} /{ }^{\circ} \mathrm{C}$, respectively.

For data of BHCC, hot streams (H1, H2) and hot utility (HU) temperatures as well as CP values are considered. The detailed computation for BHCC is shown in Table 10. Similarly, data of BCCC is computed and presented in Table 11.

Table 10: Table for BHCC data

Table 11: Table for BCCC data

| temperature | C1 |  | CU | $\begin{aligned} & \text { CUM CP } \\ & \left(\mathrm{MW} .{ }^{\circ} \mathrm{C}^{-1}\right) \end{aligned}$ | $\begin{aligned} & \mathrm{Qc}=\Delta \mathrm{T} * \Sigma \mathrm{CP} \\ & (\mathrm{MW}) \end{aligned}$ | CUM Qc (MW) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 25 |  |  |  | 0 | 0 | 0 |
| 35 |  | C2 | $\downarrow$ | 1.14 | 11.4 | 11.4 |
| 145 |  |  | 0.89 | 0.25 | 27.5 | 38.9 |
| 185 | $\downarrow$ |  |  | 0.57 | 22.8 | 61.7 |
| 235 | 0.25 | $\downarrow$ |  | 0.32 | 16 | 77.7 |

Data of BHCC and BCCC are plotted in Figure 3 using CumQh and CumQc of Table 10 and 11, respectively. Figure 3 clearly indicates that what temperatures of BCCC are unknown for known
temperatures of BHCC and vice versa. Cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are presented in Table 12. In this table the cumulative enthalpies are also shown where unknown temperatures of BHCC and BCCC are available.

Figure 3: Graphical representation of balanced hot and cold composite curve

Table 12: Calculation of unknown temperatures of balanced hot and cold composite curve

| Enthalpy interval No. | Cumulative enthalpy, <br> CumQ, MW | $\mathrm{T}_{\mathrm{hi}}\left({ }^{\circ} \mathrm{C}\right)$ | BHCC <br> Temp | $\mathrm{T}_{\mathrm{Ci}}\left({ }^{\circ} \mathrm{C}\right)$ | $\begin{aligned} & \text { BCCC } \\ & \text { Temp } \end{aligned}$ | $\begin{array}{r} \Sigma \mathrm{CP} \\ \mathrm{MW} /{ }^{\circ} \mathrm{C} \end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 50 | Th1 | 25 | Tc1 | 0 |
| 1 | 3.2 | 70 | Th2 | unknown | Tc2 | 0.16 |
| 2 | 11.4 | unknown | Th3 | 35 | Tc3 | 1.14 |
| 3 | 38.9 | unknown | Th4 | 145 | Tc4 | 0.25 |
| 4 | 53.6 | 190 | Th5 | unknown | Tc5 | 0.42 |
| 5 | 61.7 | unknown | Th6 | 185 | Tc6 | 0.57 |
| 6 | 63.04 | 249 | Th7 | unknown | Tc7 | 0.16 |
| 7 | 76.1 | 250 | Th8 | unknown | Tc8 | 13.06 |
| 8 | 77.7 | 260 | Th9 | 235 | Tc9 | 0.32 |

The next step is to calculate the unknown temperatures in each enthalpy interval as carried out for Problem 1.

The unknown temperatures of BHCC can be computed as shown below:
$\mathrm{Th} 3=190-((53.6-11.4) /(0.42))=89.52^{\circ} \mathrm{C}$
$\mathrm{Th} 4=190-((53.6-38.9) /(0.42))=155^{\circ} \mathrm{C}$
Th6 $=249-((63.04-61.7) /(0.16))=240.6^{\circ} \mathrm{C}$
The unknown temperatures of BCCC are predicted as:
$\mathrm{Tc} 2=35-((11.4-3.2) /(1.14))=27.8^{\circ} \mathrm{C}$
$\mathrm{Tc} 5=185-((61.7-53.6) /(0.57))=170.79^{\circ} \mathrm{C}$
$\mathrm{Tc} 7=235-((77.7-63.04) /(0.32))=189.18^{\circ} \mathrm{C}$
$\mathrm{Tc} 8=235-((77.7-76.1) /(0.32))=230^{\circ} \mathrm{C}$

Cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC are shown in Table 13.

Computation of $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}$ and $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{c}}$ in each interval is carried out as shown below:
For interval no. 1
$\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}=(0.16 / 0.0009)=177.78$
$\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{c}}=(0.25 / 0.0008)+(0.89 / 0.001)=1202.5$
For interval no. 2
$\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}=(0.16 / 0.0009)+(0.26 / 0.001)=437.78$
$\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{c}}=(0.25 / 0.0008)+(0.89 / 0.001)=1202.5$

Table 13: Cumulative enthalpies at different temperature intervals along with known interval temperatures of BHCC and BCCC

$\sum(\mathrm{Q} / \mathrm{h})$, LMTD and area (A) for different enthalpy intervals are computed as:

For interval No. 1 -
$\sum(\mathrm{Q} / \mathrm{h})_{1}=(70-50)^{*} 177.78+(27.8-25)^{*} 1202.5=6922.6$
LMTD $_{1}=(50-25)-(70-27.8) / \ln (25 / 42.2)=32.85$
$\mathrm{A}_{1}=\sum(\mathrm{Q} / \mathrm{h})_{1} / \mathrm{LMTD}_{1}=6922.6 / 32.85=210.73 \mathrm{~m}^{2}$

For interval No. 2 -
$\sum(\mathrm{Q} / \mathrm{h})_{2}=(89.52-70) * 437.78+(35-27.8) * 1202.5=17203.46$
LMTD $_{2}=(70-27.8)-(89.52-35) / \ln (42.2 / 54.52)=48.097$
$\mathrm{A}_{2}=\sum(\mathrm{Q} / \mathrm{h})_{2} / \mathrm{LMTD}_{2}=357.68 \mathrm{~m}^{2}$
The values of $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}, \Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{c}}, \Sigma(\mathrm{Q} / \mathrm{h})_{\mathrm{I}}$, LMTD and A for each interval are shown in Table 14 , which gives total heat transfer area as $\mathbf{6 5 2 0 . 6 3 6} \mathbf{~ m}^{2}$.

Table 14: Computation of Thi, Tci, $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}, \Sigma(\mathrm{CP} / \mathrm{h}){ }_{\mathrm{c}}, \Sigma(\mathrm{Q} / \mathrm{h})_{\mathrm{I}},(\mathrm{LMTD})_{\mathrm{i}}$ and $\mathrm{A}_{\mathrm{i}}$

| Interval | Thi $\left({ }^{\circ} \mathrm{C}\right)$ | Tci $\left({ }^{\circ} \mathrm{C}\right)$ | $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{h}}$ <br> $\left(\mathrm{m}^{2}\right)$ | $\Sigma(\mathrm{CP} / \mathrm{h})_{\mathrm{c}}$ <br> $\left(\mathrm{m}^{2}\right)$ | $\Sigma(\mathrm{Q} / \mathrm{h})_{\mathrm{i}}$ <br> $\left(\mathrm{m}^{2} .{ }^{\circ} \mathrm{C}\right)$ | $(\mathrm{LMTD}) \mathrm{i}$ <br> $\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{A}\left(\mathrm{m}^{2}\right)$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 50 | 25 | 0 | 0 | 0 | 0 | 0 |
| 1 | 70 | 27.8 | 177.78 | 1202.5 | 6922.6 | 32.85 | 210.73 |
