## Moment Resistance

The compression flange is fully restrained over the sagging moment region but it is unrestrained over the hogging moment region, that is, over the internal support.

However unrestrained length is very short and lateral torsional buckling is not critical.

The moment resistance of the restrained beam is:

$$
M_{c x}=Z_{x r} p_{y}

$$

$W=29.3 / 1.5=19.5 \mathrm{kN}$

$$
\delta_{\max }=\frac{3}{384} \frac{19.5 \times 10^{3} \times 4500^{3}}{205 \times 10^{3} \times 1036 \times 10^{4}}=6.53 \mathrm{~mm}
