

Another example

$S \rightarrow iEtSS' \mid a$
 $S' \rightarrow eS \mid \epsilon$
 $E \rightarrow b$

$\text{First}(S) = \{i, a\}$

$\text{First}(S') = \{e, \epsilon\}$

$\text{First}(E) = \{b\}$

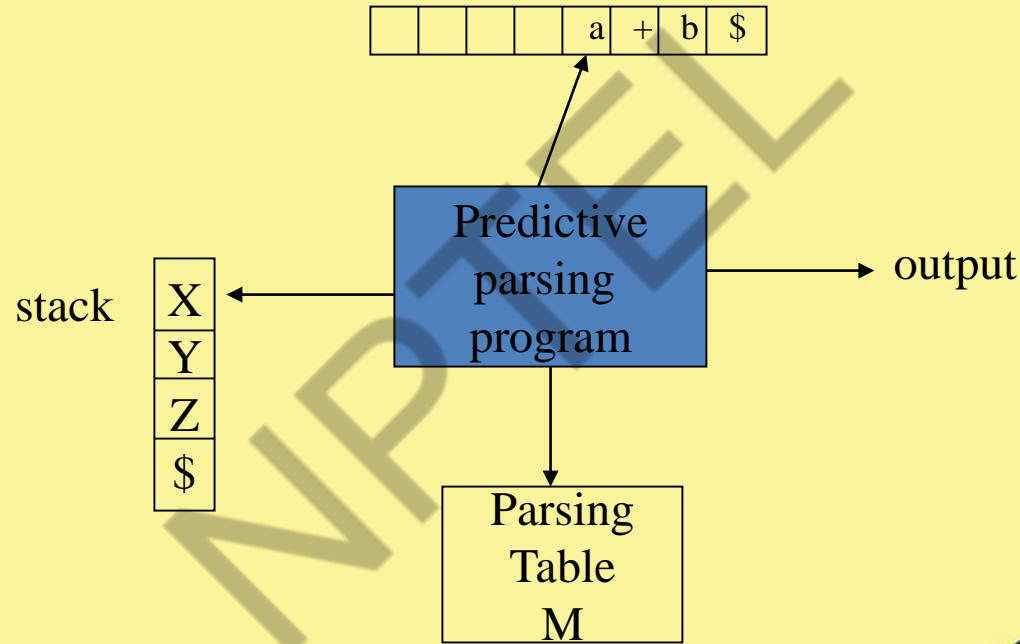

$\text{Follow}(S) = \{\$, e\}$

$\text{Follow}(S') = \{\$, e\}$

$\text{Follow}(E) = \{t\}$

Non - terminal	Input Symbol					
	a	b	e	i	t	\$
S	$S \rightarrow a$			$S \rightarrow iEtSS'$		
S'			$S' \rightarrow \epsilon$ $S' \rightarrow eS$			$S' \rightarrow \epsilon$
E		$E \rightarrow b$				

Non-recursive predicting parsing

Predictive parsing algorithm

```
While (stack is not empty) do
    Let X be the top symbol in the stack;
    Let a be the next input symbol;
    if (X is a) pop the stack and advance input pointer;
    else if (X is a terminal) error();
    else if (M[X,a] is an error entry) error();
    else if (M[X,a] = X->Y1Y2..Yk) {
        output the production X->Y1Y2..Yk;
        pop the stack;
        push Yk,...,Y2,Y1 on to the stack with Y1 on top;
    }
```

Example

id+id*id\$

Stack	Input	Action
E	id+id*id\$	Parse E \rightarrow TE'
E'T	id+id*id\$	Parse E' \rightarrow FT'
E'T'F	id+id*id\$	Parse F \rightarrow id
E'T'id	id+id*id\$	Advance input
E'T'	+id*id\$	Parse T' \rightarrow ϵ
E'	+id*id\$	Parse E' \rightarrow +TE'
E'T+	+id*id\$	Advance input
E'T	id*id\$	Parse T \rightarrow FT'

Stack	Input	Action
E'T'F	id*id\$	Parse F \rightarrow id
E'T'id	id*id\$	Advance input
E'T'	*id\$	Parse T' \rightarrow *FT'
E'T'F*	*id\$	Advance input
E'T'F	id\$	Parse F \rightarrow id
E'T'id	id\$	Advance input
E'T'	\$	Parse T' \rightarrow ϵ
E'	\$	Parse E' \rightarrow ϵ
	\$	Done

Non - terminal	Input Symbol					
	id	+	*	()	\$
E	E \rightarrow TE'			E \rightarrow TE'		
E'		E' \rightarrow +TE'			E' \rightarrow ϵ	E' \rightarrow ϵ
T	T \rightarrow FT'			T \rightarrow FT'		
T'		T' \rightarrow ϵ	T' \rightarrow *FT'		T' \rightarrow ϵ	T' \rightarrow ϵ
F	F \rightarrow id			F \rightarrow (E)		

Bottom-up Parsing

Introduction

- Constructs parse tree for an input string beginning at the leaves (the bottom) and working towards the root (the top)
- Example: $\text{id} * \text{id}$

$E \rightarrow E + T \mid T$
 $T \rightarrow T * F \mid F$
 $F \rightarrow (E) \mid \text{id}$

Shift-reduce parser

- The general idea is to shift some symbols of input to the stack until a reduction can be applied
- At each reduction step, a specific substring matching the body of a production is replaced by the nonterminal at the head of the production
- The key decisions during bottom-up parsing are about when to reduce and about what production to apply
- A reduction is a reverse of a step in a derivation
- The goal of a bottom-up parser is to construct a derivation in reverse:
 - $E \Rightarrow T \Rightarrow T * F \Rightarrow T * id \Rightarrow F * id \Rightarrow id * id$

Handle pruning

- A Handle is a substring that matches the body of a production and whose reduction represents one step along the reverse of a rightmost derivation

Right sentential form	Handle	Reducing production
id*id	id	$F \rightarrow id$
$F*id$	F	$T \rightarrow F$
$T*id$	id	$F \rightarrow id$
$T*F$	$T*F$	$E \rightarrow T*F$

Shift reduce parsing

- A stack is used to hold grammar symbols
- Handle always appear on top of the stack
- Initial configuration:

Stack	Input
\$	w\$

- Acceptance configuration

Stack	Input
\$S	\$

Shift reduce parsing (cont.)

- Basic operations:

- Shift
- Reduce
- Accept
- Error

- Example: $id*id$

Stack	Input	Action
\$	$id*id\$$	shift
$\$id$	$*id\$$	reduce by $F \rightarrow id$
$\$F$	$*id\$$	reduce by $T \rightarrow F$
$\$T$	$*id\$$	shift
$\$T*$	$id\$$	shift
$\$T*id$	$\$$	reduce by $F \rightarrow id$
$\$T*F$	$\$$	reduce by $T \rightarrow T*F$
$\$T$	$\$$	reduce by $E \rightarrow T$
$\$E$	$\$$	accept

Handle will appear on top of the stack

Stack

\$ α β γ

\$ α β B

\$ α β By

Input

yz\$

yz\$

z\$

Stack

\$ α γ

\$ α Bxy

Input

xyz\$

z\$

Conflicts during shift reduce parsing

- Two kind of conflicts
 - Shift/reduce conflict
 - Reduce/reduce conflict
- Example:

```
stmt → If expr then stmt
      | If expr then stmt else stmt
      | other
```

Stack
... if expr then stmt

Input
else ...\$

Reduce/reduce conflict

stmt -> id(parameter_list)

stmt -> expr:=expr

parameter_list->parameter_list, parameter

parameter_list->parameter

parameter->id

expr->id(expr_list)

expr->id

expr_list->expr_list, expr

expr_list->expr

Stack
... id(id

Input
,id) ...\$

Bottom-Up Parsing

- Operator Precedence Parsing
- LR Parsing

Operator Precedence Parsing

Operator Grammar

- No ϵ -transition
- No two adjacent non-terminals

Eg.

$$E \rightarrow E \text{ op } E \mid \text{id}$$
$$\text{op} \rightarrow + \mid *$$

The above grammar is not an operator grammar
but:

$$E \rightarrow E + E \mid E * E \mid \text{id}$$

Operator Precedence

- If a has higher precedence over b; $a \cdot > b$
- If a has lower precedence over b; $a < \cdot b$
- If a and b have equal precedence; $a \doteq b$

Note:

- id has higher precedence than any other symbol
- \$ has lowest precedence.
- if two operators have equal precedence, then we check the **Associativity** of that particular operator.

Precedence Table

	id	+	*	\$
id		·>	·>	·>
+	<·	·>	<·	·>
*	<·	·>	·>	·>
\$	<·	<·	<·	·>

Example: $w = \$id + id * id\$$
 $\$ < \cdot id \cdot > + < \cdot id \cdot > * < \cdot id \cdot > \$$

Basic Principle

- Scan input string left to right, try to detect $\cdot >$ and put a pointer on its location.
- Now scan backwards till reaching $< \cdot$.
- String between $< \cdot$ and $\cdot >$ is our handle.
- Replace handle by the head of the respective production.
- REPEAT until reaching start symbol.

Algorithm

```
Initialize stack to $
while true do
  let  $U$  be the topmost terminal in the stack
  let  $V$  be the next input symbol
  if  $U = \$$  and  $V = \$$  then return
  if  $U < \cdot V$  or  $U \doteq V$  then
    shift  $V$  onto stack
    advance input pointer
  else if  $U \cdot > V$  then
    do
      pop the topmost symbol, call it  $V$ , from the stack
    until the top of the stack is  $< \cdot V$ 
  else
    error
end
```

Example

STACK	INPUT	ACTION/REMARK
\$	id + id * id\$	\$ <· id
\$ id	+ id * id\$	id ·> +
\$	+ id * id\$	\$ <· +
\$ +	id * id\$	+ <· id
\$ + id	* id\$	id ·> *
\$ +	* id\$	+ <· *
\$ + *	id\$	* <· id
\$ + * id	\$	id ·> \$
\$ + *	\$	* ·> \$
\$ +	\$	+ ·> \$
\$	\$	accept

	id	+	*	\$
id		·>	·>	·>
+	<·	·>	<·	·>
*	<·	·>	·>	·>
\$	<·	<·	<·	·>

Establishing Precedence Relationships

- Construct two lists: Firstop+, Lastop+
- Firstop+: List of all terminals which can appear first on any right hand side of a production
- Lastop+: List of terminals that can appear last on any right hand side of a production

Firststop and Lastop

- For $X \rightarrow a... | Bc$, put a, B, c in Firststop(X)
- For $Y \rightarrow ...u | ...vW$, put u, v, W in Lastop(Y)
- Compute Firststop+ and Lastop+ using Closure algorithm
 - Take each nonterminal in turn, in any order and look for it in all the Firststop lists. Add its own first symbol list to any other in which it occurs
 - Similarly process Lastop list
 - Drop all nonterminals from the lists

Constructing Precedence Matrix

- Whenever terminal a immediately precedes nonterminal B in any production, put $a < \cdot \alpha$ where α is any terminal in the First $stop^+$ list of B
- Whenever terminal b immediately follows nonterminal C in any production, put $\beta \cdot > b$ where β is any terminal in the Last $stop^+$ list of C
- Whenever a sequence aBc or ac occurs in any production, put $a \doteq c$
- Add relations $\$ < \cdot a$ and $a \cdot > \$$ for all terminals in the First $stop^+$ and Last $stop^+$ lists, respectively of S

Example

$E \rightarrow E + T \mid T$

$T \rightarrow T * F \mid F$

$F \rightarrow (E) \mid id$

$Firstop(E) = \{E, +, T\}$

$Firstop(T) = \{T, *, F\}$

$Firstop(F) = \{ (, id \}$

$Lastop(E) = \{+, T\}$

$Lastop(T) = \{*, F\}$

$Lastop(F) = \{), id \}$

$Firstop+(E) = \{E, +, T, *, F, (, id\}$

$Firstop+(T) = \{T, *, F, (, id\}$

$Firstop+(F) = \{ (, id \}$

$Lastop+(E) = \{+, T, *, F,), id\}$

$Lastop+(T) = \{*, F,), id\}$

$Lastop+(F) = \{), id \}$

$Firstop+(E) = \{+, *, (, id\}$

$Firstop+(T) = \{*, (, id\}$

$Firstop+(F) = \{ (, id \}$

$Lastop+(E) = \{+, *,), id\}$

$Lastop+(T) = \{*,), id\}$

$Lastop+(F) = \{), id \}$

Example (Contd.)

$E \rightarrow E + T \mid T$
 $T \rightarrow T * F \mid F$
 $F \rightarrow (E) \mid id$

Firststop+(E) = {+, *, (, id}

Firststop+(T) = {*, (, id}

Firststop+(F) = {(, id}

Lastop+(E) = {+, *,), id}

Lastop+(T) = {*,), id}

Lastop+(F) = {), id}

	\$	()	id	+	*
\$		<.		<.	<.	<.
(<.	=	<.	<.	<.
)	.>		.>		.>	.>
id	.>		.>		.>	.>
+	.>	<.	.>	<.	.>	<.
*	.>	<.	.>	<.	.>	.>
