

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"**The Lecture Contains:**

- ☰ Prisoner's Dilemma – EFG representation
- ☰ Definition of I set
- ☰ Singleton & Non-singleton I set
- ☰ Another example of NFG  $\rightarrow$  EFG
- ☰ EFG  $\rightarrow$  NFG
- ☰ Example EFG  $\rightarrow$  NFG

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"

Any simultaneous game can also be represented by on EFG.

e.g. Prisoner's Dilemma – EFG representation

- Prisoner 1 or Prisoner 2 - anybody can be the first mover.
- Prisoner 1 is first mover in this example and has 2 strategies – C and NC.
- Whatever prisoner 1 chooses, prisoner 2 also has 2 strategies at his move – C and NC.
- Prisoner 2 cannot distinguish between the two decision nodes since it is a simultaneous game.
- Prisoner 2 has one information set (I - set) consisting of two decision nodes.

**Note:** I-set usually represented by a dotted line connecting the two nodes.

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"**Definition of I set**

An I set for a player is a collection of decision nodes such that

1. At each decision node of the information set the concerned player has the move.

2. If the play of the game reaches a particular decision node of an I set, then the concerned player does not know which node in the info set has been reached.
  - This implies that the set of feasible actions at each decision node of an I set should be the same.

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"**Singleton & Non-singleton I set**

- **Singleton I set:** An I set containing exactly one decision node.  
[Note: Any decision node (except the terminal nodes) can be viewed as a singleton I set .]
- **Non-singleton I set:** An I set containing more than one decision node.
- **Static games:** EFG representation will contain at least one non-singleton info set.
- **Dynamic games** (with perfect information) will always contain only singleton I sets.

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"Another example of NFG  $\rightarrow$  EFG

## Battle of sexes:

## NFG:

		Husband	
		B	M
Wife	B	(3,1)	(0,0)
	M	(0,0)	(1,3)

## EFG:

## Module 2: "Static games of complete information"

Lecture 3: "NFG  $\rightarrow$  EFG & EFG  $\rightarrow$  NFG Conversion"EFG  $\rightarrow$  NFG

## Example of a Dynamic game

Strategy – different from action.

A strategy is a complete plan of actions.

- Specifies a feasible action for the player in every contingency in which the player might be called on to act.

Here player 2 has 2 actions (l & r).

Player 2 has two contingencies in which he can act.

- After observing L by player 1.
- After observing R by player 1.

Therefore, strategies of player 2 are :

1. (l, l): If player 1 plays L then play l and if player 1 plays R then play l.
2. (l, r): If player 1 plays L then play l and if player 1 plays R then play r.
3. (r, l): If player 1 plays L then play r and if player 1 plays R then play l.
4. (r, r): If player 1 plays L then play r and if player 1 plays R then play r.

Example EFG → NFG

Player 1 has 2 actions as well as 2 strategies (L & R)

		Player 2			
		ll	lr	rl	rr
Player 1	L	(3,1)	(3,1)	(1,2)	(1,2)
	R	(2,1)	(0,0)	(2,1)	(0,0)

Strategy of player 2 : (x y)

x : action if player 1 plays L

y : action if player 1 plays R
